Abstract

The invention relates to a gate for ball games, particularly applicable to football, handball hockey, etc. According to the invention, the gate comprises two parallelipipedic metal frames, namely a frame (1) having the sizes of a classical gate for said game and a second frame (2) of bigger sizes covering the first frame (1) so as to have the opening in the same front plane and the centre on the same vertical line as the first frame. The lateral, rear and upper sides of both frames (1, 2) are covered with a net (3) with meshes smaller than the ball size. The height (H2) of the second frame exceeds the height (H1) of the first frame by at least a ball size, and the lateral opening thereof (L2) exceeds the opening of the first frame (L1) on both sides, so as to allow the goalkeeper to take the ball.
